# Direct and Spillover Effects of Vocational Training

KUGLER ET AL. (2016)

#### Effects on formal education

- The most innovative part of this project is the complementarity of VT and schooling.
  - Contrast with similar programs in SSA, where similar training programs fail – potentially because of the lack of complementary skills/education.
    - × However, YiA also worked for low-educated workers who did not go back to school.
- Reminiscent of Jensen and Miller (2015)

#### Sustained effects on LM outcomes

- Effects on formal sector participation and earnings sustained in the longer-run...
- Why didn't these effects fade out?
  - Meaningful and relevant HC accumulation
  - Performance-based financing may have played a role here...
- The heterogeneity of effects by gender very similar to Blattman, Fiala, and Martinez (2014)
  - ...and, to some extent, provide a meaningful contrast to de Mel, Mckenzie, and Woodruff (2008; 2012)

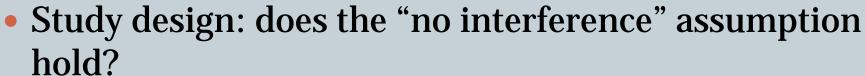

#### Spillover effects on relatives

- Good data work using the SISBEN.
  - Fortunate to be able to match relatives of both T and C equally well...
- Positive spillovers on siblings (younger?) finishing high school:
  - Effects higher for lower educated applicants at baseline
  - Also higher for same sex siblings
- Effects on siblings important and can be divergent from others in the community (Baird, de Hoop, Özler 2013)

## Some suggestions...

• Study design: does the "no interference" assumption hold?

## Suggestions

| 110  | nu:       |           |           |           |  |  |  |  |  |
|--|-----------|-----------|-----------|-----------|--|--|--|--|--|
| Blocked Design: 50% of every cluster is treated:   |           |           |           |           |  |  |  |  |  |
|  | Cluster 1 | Cluster 2 | Cluster 3 | Cluster 4 |  |  |  |  |  |
|  |           |           |           |           |  |  |  |  |  |
| Clustered Design: 50% of clusters are completely treated:  |           |           |           |           |  |  |  |  |  |
| _  | Cluster 1 | Cluster 2 | Cluster 3 | Cluster 4 |  |  |  |  |  |
|  |           |           |           |           |  |  |  |  |  |
|  |           |           |           |           |  |  |  |  |  |
| Partial Population Design: Both 'pure' controls and 'within cluster' controls, saturation fixed: |           |           |           |           |  |  |  |  |  |
|  | Cluster 1 | Cluster 2 | Cluster 3 | Cluster 4 |  |  |  |  |  |
|  |           |           |           |           |  |  |  |  |  |
|  |           |           |           |           |  |  |  |  |  |
| Randomized Saturation Design: Treatment saturations directly randomized:                         |           |           |           |           |  |  |  |  |  |
|  | Cluster 1 | Cluster 2 | Cluster 3 | Cluster 4 |  |  |  |  |  |
|  |           |           |           |           |  |  |  |  |  |

#### Some suggestions...

• Study design: does the "no interference" assumption hold?

- Heterogeneity by "tightness of the labor market," but concerns about:
  - Endogeneity
  - Lack of variation
  - Lack of power

#### AKM (2011 – Table 6, Panel A)

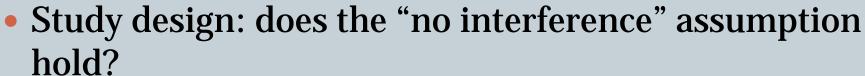

TABLE 6—DIFFERENTIAL IMPACT OF TREATMENT IN COURSES WITH LOW DEMAND

|   | Employment        | Paid<br>employment | Formal employment | Contract          |
|---|-------------------|--------------------|-------------------|-------------------|
| Panel A. Women                          |                   |                    |                   |                   |
| Treated                                 | 0.057<br>(0.036)  | 0.063<br>(0.040)   | 0.091<br>(0.033)  | 0.105<br>(0.030)  |
| Treated × high probability of treatment | -0.006<br>(0.061) | (0.063)            | -0.053<br>(0.0820 | -0.074<br>(0.090) |
| Observations                            | 1,367             | 1,474              | 1,202             | 1,173             |

#### Some suggestions...

- Study design: does the "no interference" assumption hold?
- Heterogeneity by "tightness of the labor market," but concerns about:
  - Endogeneity
  - Lack of variation
  - Lack of power
- Other RCTs also fall into this trap, so it would be useful to have proper spillover designs to establish some baseline in new explorations...

## Suggestions

| Randomized Saturation Design: Treatment saturations directly randomized:                         |           |           |           |           |  |  |  |  |  |
|  | Cluster 1 | Cluster 2 | Cluster 3 | Cluster 4 |  |  |  |  |  |
|  |           |           |           |           |  |  |  |  |  |

#### More (minor) suggestions

- Number of tables and analysis of heterogeneity
  - 16 tables all broken down by sex, education, and also follow-up duration.
- I'd suggest a smaller number of tables that show direct and spillover effects for multiple outcomes, then one or two tables for heterogeneity.
  - Interact the effects with continuous years of education and sex;
  - Consistent with the fully-interacted model preferred by Imbens and Rubin (2015)...

#### Suggestions

- Clarify the distinction between being matched to administrative data vs. the outcome being an extensive or intensive margin variable
  - Appendix of variable definitions would be useful
  - Interpretation of geographic mobility?
- Baseline imbalance
  - Show F-test of joint significance?
  - O Did randomization go OK? (more detail would be useful)
    - **▼** Imbalance more likely when P(T) moves away from 0.5...
- Did losers re-enter other lotteries?
  - Similar to issues of migration lotteries in the Pacific Islands...
